

A COOL SUMMER TAIL

BY CARRIE A. PEARSON
ILLUSTRATED BY CHRISTINA WALD

A COOL SUMMER TAIL

When summer heats up, animals find ways to stay cool. Just as animals wonder how humans stay warm in *A Warm Winter Tail*, animals in *A Cool Summer Tail* wonder how humans stay cool in the hot summer heat. Do they dig under the dirt, grow special summer hair, or only come out at night? Many of the same animals are featured in both books, offering an important compare and contrast opportunity of how animals adapt to seasonal changes.

Animals in the book include: red fox, painted turtle, black-capped chickadee, black bear, white-tailed deer, honeybee, grey squirrel, black swallowtail, wood frog, garter snake, and Costa's hummingbird.

It's so much more than a picture book . . . this book is specifically designed to be both a fun-to-read story and a launch pad for discussions and learning. Whether read at home or in a classroom, we encourage adults to do the activities with the young children in their lives. Free online resources and support at ArbordalePublishing.com include:

Award-winning author **Carrie A. (Ann) Pearson** is a former early elementary teacher and the winner of an SCBWI-Michigan Picture Book Mentorship Award and a Work of Outstanding Promise grant. *A Cool Summer Tail*, and the companion, *A Warm Winter Tail* (Gelett Burgess Award and 2013-2014 Great Lakes Great Books Literature Program) follow many of the same animals to describe how they manage the hot summer and cold winter weather. Carrie and her family live in the upper peninsula of Michigan. Visit her website at www.carriepearsonbooks.com.

In addition to illustrating *A Cool Summer Tail*, *A Warm Winter Tail*, *Habitat Spy*, *Little Red Bat*, and *Henry the Impatient Heron* for Arbordale, **Christina Wald** has illustrated for a wide variety of toys, games, books, and magazines. Christina enjoys the research aspect of each project, saying that each new book is a fascinating new learning experience. She lives in Ohio with her husband and three cats. Visit Christina's website at www.christinawald.com.

A COOL SUMMER TAIL

by Carrie A. Pearson illustrated by Christina Wald

How do humans stay cool in the summer, Mama?
Do they hang out their tongues,
like a spring that's been sprung,
breathing fast in and out like this?

No panting! No puffing!
No *huh, huh, huh huffing!*
They sweat through their skin when it's hot.

**How do humans stay cool in the summer?
Do they slide into ponds
under awnings of fronds
and let cool water wrap their shells?**

**No splashing with sunfish.
No stepping in mud-squish.
They swim in clear water with kids.**

**How do humans stay cool in the summer, Mama?
Do they perch in the shade
under leaves dappled jade
with their feet curling 'round a branch?**

**No perching on branches,
up high taking chances.
It's safer for them on the earth.**

**How do humans stay cool in the summer, Mama?
Do they lie bottoms up,
like a big furry pup,
spreading out on the cooler ground?**

**No napping on patches
of cool earth that scratches.
Their beds are much softer than ours.**

For Creative Minds

The For Creative Minds educational section may be photocopied or printed from our website by the owner of this book for educational, non-commercial uses. Animals and Summer Adaptation Fun Facts

Animals have many different ways to stay cool when summer temperatures soar. Which of these might YOU do to stay cool in the summer heat? Have you ever seen an animal do any of these?

Some mammals pant, or breathe in and out very quickly with their tongues sticking out. The moisture on their tongues cools the air going into their bodies, helping them to cool down.

All kinds of animals jump into or spray themselves with water or mud to cool down. The cooler temperature of the water or mud helps to cool off their bodies.

Some animals release water onto their outer skin (sweat). The evaporating water then cools the animals' bodies. Other animals don't make their own water or sweat so they have to put water onto their skin by licking themselves (spit bath).

Other animals might burrow into cool soil or hide under rocks. The cooler dirt helps to lower body temperatures.

Some animals hide in the shade where it is cooler.

Some animals migrate to higher elevations or cooler climates.

Still other animals might sleep or nap during the day and be more active in the evening or at night when it is cooler.

Summer and Winter Adaptations: Compare and Contrast

These animals are also featured in the companion book, *A Warm Winter Tail*. By looking at the images below, can you describe:

- How do the animals look the same or different in the summer and the winter?
- After reading both books, can you describe some of the differences that we might not be able to see?
- How does the surrounding area (the habitat) look? Is it the same or different in the summer and the winter?
- What are some things that might be different between the two seasons that you don't see in the illustrations but might be able to feel?

Summer Animal Matching Activity

Painted turtles

grey squirrels

black bears

white-tailed deer

honeybees

black-capped chickadees

Match the animal to its description. Then match the colors to identify the animal classes. Which animals are **insects**, amphibians, **reptiles**, **birds**, or **mammals**?

1 These **mammals** don't have sweat glands like humans so they lick their forearms where their hair is thinner. The saliva evaporates and carries heat away from their body.

2 On a hot day, these **mammals** often lie on their backs, exposing their bellies with thinner fur. Their body heat escapes.

3 To lower their temperature, these cold-blooded **reptiles** look for the cool water found in ponds, lakes, and streams.

4 You can find these tough, little **birds** hiding from the hot sun under the shade of leafy trees. They also might stand with their feet in puddles of water or open their beaks and breathe quickly.

5 In late spring, these **mammals** shed their heavy winter hair and grow a new coat of fine, short, reddish hair. This special coat allows air to move over the animals' bodies.

6 During the day, these **insects** fan their queen to cool her. At night, they may hang from the outside of the hive to catch the cooler air and fan it inside the hive.

Answers: 1) grey squirrels, 2) black bears, 3) painted turtles, 4) Black-capped chickadees, 5) white-tailed deer, 6) honeybees
mammals: grey squirrels, black bears, white-tailed deer
reptile: painted turtles
bird: Black-capped chickadees
insect: honeybees

black swallowtails

garter snakes

humans

Costa's hummingbirds

wood frogs

red foxes

and Animal Classes

7 These **reptiles** are good at keeping their temperature just right, but if it gets too hot, they might den up during the heat of the day and come out at night to eat when it is cooler.

8 When the weather is hot, these **mammals** turn on fans or air conditioning in their homes; wear light weight clothing; go swimming in cool lakes, rivers, ponds, or pools; and sweat to cool their skin.

9 These **insects** use the warmth of the sun to keep their bodies the right temperature. If they get too hot, their outstretched wings can be used as umbrellas to shade their abdomens.

10 To cool off, these **mammals** rapidly breathe air in and out of their open mouths and across their damp tongues (pant). The heat from their body evaporates with each breath.

11 Although these **birds** are tiny, they are able to fly great distances to cooler weather. They will fly from the Southwestern Desert to the Pacific Coast in search of cooler temperatures.

12 These amphibians must keep their skin moist, even when it is hot and dry outside. So they dig under leaves and sticks to rest where it is cool and damp.

Answers: 7) garter snakes, 8) humans, 9) black swallowtail, 10) red foxes, 11) Costa's hummingbirds, 12) wood frogs
mammals: humans, red foxes
reptiles: garter snakes
birds: Costa's hummingbirds
insect: black swallowtail
amphibian: wood frogs

To Bonnie and Neil who have always helped me chase my dreams—C.A.P.
For the Cincinnati Zoo, one of my favorite sketching spots and to the painted turtles floating in the flamingo section that patiently let me draw them—C.W.
